

TRAFFIC IMPACT STUDY

FOR

RENO STEAD AIRPORT INDUSTRIAL

June 25, 2019

PREPARED FOR:

United Construction Company

PREPARED BY:

YOUR QUESTIONS ANSWERED QUICKLY

Why did you perform this study?

This Traffic Impact Study evaluates the potential traffic impacts associated with the proposed Reno Stead Airport Industrial project in Reno, Nevada. This study of potential transportation impacts was undertaken for planning purposes and to determine what traffic controls or other mitigations may be needed to reduce potential impacts, if any are identified.

What does the project consist of?

The project consists of 1,118,000 square feet of industrial warehousing space. The project site is located on approximately 58 acres in the southwest corner of the Reno Stead Airport property.

How much traffic will the project generate?

The project is anticipated to generate approximately 1,945 Daily, 190 AM peak hour, and 212 PM peak hour trips.

Are there any traffic impacts?

The eastbound approach of the Stead Boulevard/Mt Babcock Street intersection is expected to operate at LOS E with or without the project under Future Year (10 Year horizon) conditions; however, the average delay would increase by less than 5 seconds with the project. Therefore, the project does not significantly impact the intersection and mitigation is not required. Consideration should be given to implementing a “free” eastbound to southbound right-turn at the Stead Boulevard/Mt Babcock Street intersection with future projects in the Reno Stead Airport area. That change is not justified with this project. The other study intersections are expected to operate at acceptable levels of service under all project scenarios.

Are any improvements recommended?

The project proposes to construct an extension of Moya Boulevard north of Echo Avenue that would serve as the primary access to the project site. There are six proposed driveways on Moya Boulevard that would serve the two project buildings. It is recommended that each driveway approach include one inbound lane, one outbound lane, and 75 foot left-turn pockets on Moya Boulevard into the driveways where medians are provided (see **Appendix B** for the specific locations).

The Moya Boulevard extension will not align directly with the existing segment of Moya Boulevard due to right-of-way constraints. The intersection configurations shown on the exhibit in **Appendix B** are recommended to provide adequate turning radii and spacing to adjacent driveways. The

alignment/connection of Moya Boulevard shall be designed and constructed with appropriate tapers and transition lengths and meet applicable design standards.

The Moya Boulevard extension would also cross over a minor railroad spur line that currently serves the General Motors building to the west of Moya Boulevard. The railroad crossing shall be designed and constructed to meet Union Pacific Railroad (UPRR) standards and permit requirements. A separate application must be submitted and approved by the Nevada Public Utilities Commission to obtain approval for the railroad crossing prior to the start of construction.

The project shall pay the appropriate Regional Road Impact Fees (RRIF) based on the Regional Transportation Commission's RRIF Schedule. The estimated fees are approximately \$635,000.

INTRODUCTION

This Traffic Impact Study evaluates the potential traffic impacts associated with the proposed Reno Stead Airport Industrial project in Reno, Nevada. This study of potential transportation impacts was undertaken for planning purposes and to determine what traffic controls or other mitigations are needed to manage the project traffic.

Project Description

The proposed project includes 1,118,000 square feet of warehouse/industrial space located in the southwest corner of the Reno Stead Airport property. The project site consists of approximately 58 acres and would be accessed via an extension of Moya Boulevard into the airport property. The project location is shown on **Figure 1** and the site plan is shown on **Figure 2**.

Study Area and Evaluated Scenarios

The following intersections (shown on **Figure 1**) are included in the analysis:

- ▶ Moya Boulevard/Echo Avenue
- ▶ Echo Avenue/Mt Anderson Street
- ▶ Moya Boulevard/Lear Boulevard
- ▶ Stead Boulevard/Mt Babcock Street
- ▶ Stead Boulevard/Lear Boulevard
- ▶ Lear Boulevard/Military Road
- ▶ Moya Boulevard/Red Rock Road

This study includes analysis of the weekday AM and PM peak hours as these are the periods of time in which peak traffic is anticipated to occur. The evaluated development scenarios are:

- ▶ Existing Conditions (No Project)
- ▶ Existing Plus Project Conditions
- ▶ Future Year (10 Year Horizon) No Project Conditions
- ▶ Future Year Plus Project Conditions

ANALYSIS METHODOLOGY

Level of service (LOS) is a term commonly used by transportation practitioners to measure and describe the operational characteristics of intersections, roadway segments, and other facilities. This term equates seconds of delay per vehicle at intersections to letter grades “A” through “F” with “A” representing optimum conditions and “F” representing breakdown or over capacity flows.

Intersections

Intersection level of service methodology is established in the *Highway Capacity Manual (HCM) 2010*, published by the Transportation Research Board (TRB). The methodology for signalized intersections determines the level of service by comparing the average control delay for the overall intersection to the delay thresholds in **Table 1**. Level of service at unsignalized (side-street stop controlled) intersections is determined by comparing the average control delay for the worst movement/approach to the delay thresholds in **Table 1**.

Table 1: Level of Service Definition for Intersections

Level of Service	Brief Description	Average Delay (seconds per vehicle)	
		Signalized Intersections	Unsignalized Intersections
A	Free flow conditions.	< 10	< 10
B	Stable conditions with some affect from other vehicles.	10 to 20	10 to 15
C	Stable conditions with significant affect from other vehicles.	20 to 35	15 to 25
D	High density traffic conditions still with stable flow.	35 to 55	25 to 35
E	At or near capacity flows.	55 to 80	35 to 50
F	Over capacity conditions.	> 80	> 50

Source: Highway Capacity Manual (2010), Chapters 18 through 21

Level of service calculations were performed using the Synchro/SimTraffic 9 software package with results reported in accordance with the current *HCM 2010* methodology.

Level of Service Policies

The Regional Transportation Commission's (RTC) *2040 Regional Transportation Plan (RTP)* establishes level of service criteria for regional roadway facilities in the City of Reno, City of Sparks, and Washoe County. The current Level of Service policy is:

- ▶ LOS D - All regional roadway facilities projected to carry less than 27,000 ADT at the latest RTP horizon
- ▶ LOS E - All regional roadway facilities projected to carry 27,000 or more ADT at the latest RTP horizon
- ▶ All intersections shall be designed to provide a level of service consistent with maintaining the policy level of service of the intersecting corridors

Where intersections are already experiencing level of service beyond the thresholds, conditions should not be exacerbated. In practice, this is commonly interpreted as not increasing average delay per vehicle by more than 5 seconds, or the volume-to-capacity ratio by more than 0.05 for roundabout intersections.

All of the study roadways are projected to carry less than 27,000 ADT at the furthest RTP horizon, therefore LOS D was used as the threshold for this project.

EXISTING CONDITIONS

Roadway Facilities

A brief description of the key roadways in the study area is provided below.

Moya Boulevard is a three-lane roadway (one lane in each direction and a two-way left-turn lane) from Red Rock Road to Silver Dawn Drive, and a two-lane roadway from Silver Dawn Drive to Industrial Circle. Moya Boulevard is classified as a Low Access Control (LAC) Arterial in the *2040 RTP*. The posted speed limit on Moya Boulevard is 45 miles per hour (mph) for vehicles and 35 mph for trucks. Moya Boulevard is a primary truck route from US 395 to the industrial area on the south side of the airport.

Echo Avenue is an east-west LAC Arterial roadway that intersects Moya Boulevard to the west and Mt Limbo Street to the east. Echo Avenue is a two-lane roadway for its entire length. The posted speed limit on Echo Avenue is 25 mph in the project area. Trucks are prohibited on Echo Avenue east of Mt Anderson Street.

Lear Boulevard is an east-west roadway with four lanes from Moya Boulevard to east of Stead Boulevard, two lanes from east of Stead Boulevard to Military Road, and three lanes (one lane in each direction and a two-way left-turn lane) east of Military Road. The *2040 RTP* classifies Lear Boulevard as a Moderate Access Control (MAC) Arterial. The posted speed limit on Lear Boulevard varies from 45 mph at the west end to 30 mph at the east end. Trucks are prohibited on Lear Boulevard east of Stead Boulevard.

Stead Boulevard is a north-south roadway that connects US 395 to Echo Avenue. The lane configurations on Stead Boulevard vary from five lanes at the south end to four lanes at the north end, with two and three lane sections in the middle. Stead Boulevard is classified as a MAC Arterial in the *2040 RTP*. The posted speed limit on Stead Boulevard is 45 mph for vehicles and 35 mph for trucks. There is also a 15 mph school zone adjacent to Stead Elementary School and O'Brien Middle School at the south end of the roadway. Trucks are prohibited on Stead Boulevard north of Mt Babcock Street. Trucks are also prohibited adjacent to Stead Elementary School and O'Brien Middle School during school pick-up and drop-off times (7:00 AM to 9:00 AM and 1:00 PM to 3:30 PM).

Red Rock Road is generally a north-south roadway with four lanes from US 395 to Moya Boulevard, and two lanes north of Moya Boulevard. The *2040 RTP* classifies Red Rock Road as a MAC Arterial. The posted speed limit on Red Rock Road near Moya Boulevard is 35 to 40 mph.

Mt Anderson Street is a two-lane roadway that connects Echo Avenue to Stead Boulevard. Mt Anderson Street is a designated truck route from Echo Avenue to Mt Babcock Street and has a 35 mph speed limit.

Mt Babcock Street is a north-south roadway that connects Echo Avenue to Stead Boulevard. South of Mt Anderson Street, Mt Babcock Street has two southbound lanes and one northbound lane and is a designated truck route. North of Mt Anderson Street, the roadway has two lanes and trucks are prohibited. The posted speed limit on Mt Babcock Street is 35 mph.

Military Road is a MAC Arterial that connects Echo Avenue to Lemmon Drive. Military Road is a two-lane roadway for the majority of its length with a short four-lane section near Lear Boulevard. The posted speed limit on Military Road is 45 mph.

Bicycle & Pedestrian Facilities

Bicycle and pedestrian facilities exist but are sporadic in the project vicinity. Bicycle lanes are present on all of Moya Boulevard, Military Road, and Stead Boulevard south of Lear Boulevard. Sidewalks are available on portions of all the study area roadways, but do not provide a fully connected network. Bicycle and pedestrian volumes are generally low in the industrial area south of the airport.

Transit Facilities

The RTC provides fixed route bus service (RIDE) throughout the Reno/Sparks area. Route 7 provides service in the immediate project vicinity on Echo Avenue, Moya Boulevard, Lear Boulevard, and Stead Boulevard. **Exhibit 1** shows the route and corresponding bus stop locations. Weekday service is provided on $\frac{1}{2}$ to 1 hour headways from 4:45 AM to 1:50 AM. Saturday service is also provided on $\frac{1}{2}$ to 1 hour headways from 5:15 AM to 1:50 AM. Sunday and holiday service is provided on one hour headways from 5:15 AM to 1:50 AM.

Traffic Volumes

Existing AM (7:00 AM to 9:00 AM) and PM (4:00 PM to 6:00 PM) peak hour traffic volumes were collected at the study intersections in April 2019 with school in regular session. **Figure 3** shows the existing intersection turning movement counts at the study intersections.

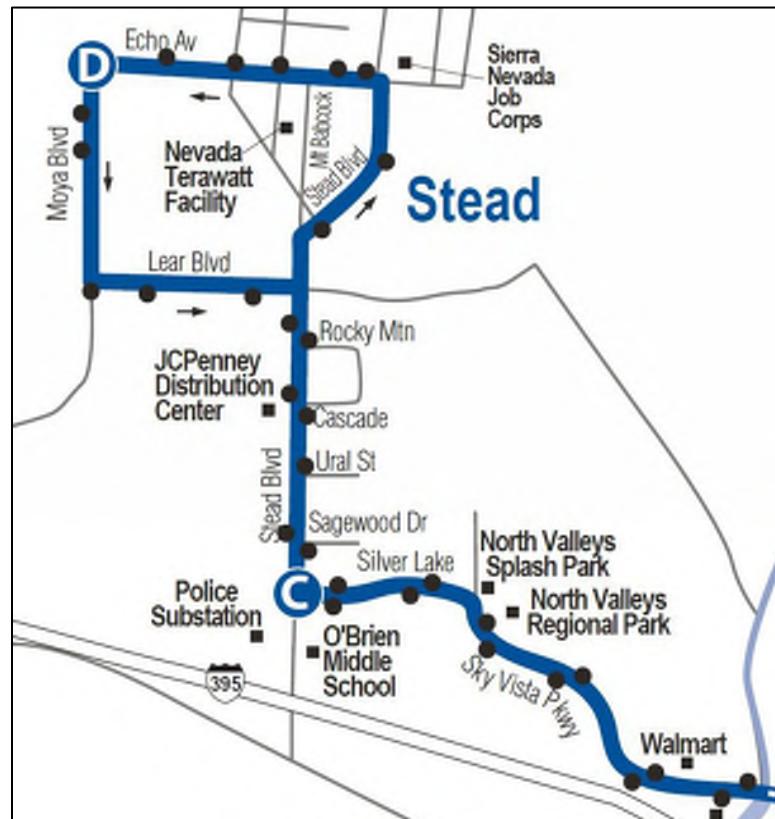

Exhibit 1: RTC RIDE Route 7 Map

Intersection Level of Service Analysis

Existing conditions intersection level of service analysis was performed using Synchro 9 software, with reports based on *HCM 2010* methodology. The Stead Boulevard/Mt Babcock Street and Lear Boulevard/Military Road intersections were analyzed using SimTraffic micro-simulation software, with results also reported based on *HCM 2010* methodology. SimTraffic has the ability to more accurately analyze side-street stop controlled intersections with multi-lane approaches. The peak hour factors (PHF) and heavy vehicle percentages from the existing counts were used in the analysis. **Figure 4** shows the existing intersection lane configurations and controls. The level of service results are presented in **Table 2** and the calculation sheets are provided in **Appendix A**, attached.

Table 2: Existing Intersection Level of Service

Intersection	Control	AM		PM	
		Delay ¹	LOS	Delay ¹	LOS
Moya Blvd/Echo Ave	Side Street Stop				
		9.0	A	9.1	A

		9.5	A	9.4	A

Notes: 1. Delay is reported in seconds per vehicle for the overall intersection for signalized intersections, and for the worst approach/movement for side street stop controlled intersections.

2. These intersections were analyzed using SimTraffic micro-simulation software.

Source: Headway Transportation, 2019

As shown in the table, the study intersections currently operate at acceptable levels of service during the AM and PM peak hours.

PROJECT CONDITIONS

Project Description

The proposed project includes 1,118,000 square feet of warehouse/industrial space located on approximately 58 acres in the southwest corner of the Reno Stead Airport property. The project location is shown on **Figure 1** and the site plan is shown on **Figure 2**.

Project Access

The project proposes to construct an extension of Moya Boulevard that would serve as the primary access to the project site. The Moya Boulevard extension would ultimately include four lanes north of Echo Avenue. As shown on the project site plan (**Figure 2**), there are six driveways on Moya Boulevard that serve the two project buildings. It is recommended that each driveway approach include one inbound lane, one outbound lane, and 75 foot left-turn pockets on Moya Boulevard into the driveways where medians are provided.

The Moya Boulevard extension would not align directly with the existing segment of Moya Boulevard due to right-of-way constraints. The intersection configurations shown on the exhibits in **Appendix B** are recommended to provide adequate turning radii and spacing to adjacent driveways. As shown on the figure, the southbound left-turn movement from Moya Boulevard to Industry Circle would be prohibited to avoid interference with a necessary driveway to the north. However, this movement has very low volumes and vehicles wanting to turn left could use Echo Avenue to Industry Circle without significant out-of-direction travel. The alignment/extension of Moya Boulevard shall be designed and constructed with appropriate tapers and transition lengths per applicable design standards.

The Moya Boulevard extension would cross over a minor railroad spur line that currently serves the General Motors building to the west of Moya Boulevard. The railroad crossing shall be designed and constructed in accordance with Union Pacific Railroad (UPRR) standards and permit requirements.

Trip Generation

Trip generation estimates for the proposed project were calculated based on average trip rates presented in the Institute of Transportation Engineers' (ITE) *Trip Generation Manual, 10th Edition*. **Table 3** shows the Daily, AM, and PM peak hour trip generation estimates for the proposed project. As shown in the table, the project is anticipated to generate approximately 1,945 Daily, 190 AM peak hour, and 212 PM peak hour trips.

Table 3: Project Trip Generation Estimates

Land Use (ITE Land Use Code)	Size ¹	Trips ²				
		Daily	AM	AM In/Out	PM	PM In/Out
Warehousing (150)	1,118 ksf	1,945	190	146 / 44	212	57 / 155
Total Trips		1,945	190	146 / 44	212	57 / 155

Notes: 1. ksf = 1,000 square feet

2. Trips calculated based on the following rates:

- Warehousing: Daily – 1.74 trips per ksf; AM – 0.17 trips per ksf (77% in/23% out); PM – 0.19 trips per du (27% in/73% out)

Source: Headway Transportation, 2019

For analysis purposes, it was assumed that approximately 1/3 of the project trips would consist of large trucks, and 2/3 would be personal vehicles (passenger cars) during the peak hours. Note that this is a conservative estimate, as a typical project of this nature has approximately 10 to 20 percent truck trips.

Trip Distribution

Project traffic would consist of large trucks and personal vehicles. The distribution of trips would be different for each type of vehicle due to truck routes and restrictions. As shown on **Figure 5**, trucks are prohibited on some of the roadways near the project site (i.e. Lear Boulevard east of Stead Boulevard, Stead Boulevard north of Mt. Babcock Street, etc.). Additionally, trucks are restricted from using Stead Boulevard adjacent to Stead Elementary School and O'Brien Middle School during school pick-up and drop-off times (7:00 AM to 9:00 AM and 1:00 PM to 3:30 PM). Truck trips were distributed to the roadway network as follows:

- ▶ AM Peak Hour
 - » 100% to/from the south via Moya Boulevard and Red Rock Road
- ▶ PM Peak Hour
 - » 60% to/from the south via Moya Boulevard and Red Rock Road
 - » 40% to/from the south via Stead Boulevard

Employee trips would be made primarily by personal vehicles. Passenger car trips were distributed to the roadway network as follows:

- ▶ 45% to/from the south via Moya Boulevard and Red Rock Road
- ▶ 30% to/from the south via Stead Boulevard
- ▶ 20% to/from the south and east via Military Road
- ▶ 5% to/from the east via Echo Avenue

The project trip distribution is shown on **Figure 5** and the project trip assignment at the study intersections is shown on **Figure 6**.

EXISTING PLUS PROJECT CONDITIONS

Traffic Volumes

Project generated trips (**Figure 6**) were added to the existing traffic volumes at the study intersections (**Figure 3**) to develop Existing Plus Project conditions traffic volumes (shown on **Figure 7**).

Intersection Level of Service Analysis

Table 4 shows the Existing Plus Project intersection level of service results for the AM and PM peak hours. The technical calculations are provided in **Appendix C**.

Table 4: Existing Plus Project Intersection Level of Service

Notes: 1. Delay is reported in seconds per vehicle for the overall intersection for signalized intersections, and for the worst approach/movement for side street stop controlled intersections.

Source: Headway Transportation, 2019

Existing Plus Project intersection level of service analysis was performed using Synchro 9 software, with results reported based on *HCM 2010* methodologies. Heavy vehicles percentages were calculated based on existing traffic volumes and the assumption that 1/3 of the project trips are large trucks. The existing peak hour factors, intersection lane configurations, and controls were used for the analysis. As shown in the table, the study intersections are expected to operate at acceptable levels of service under Existing Plus Project conditions.

FUTURE YEAR CONDITIONS – 10 YEAR HORIZON

Planned Regional Roadway Improvements

The 2040 RTP outlines programmed roadway projects of regional significance. The project list is split into three time periods: 2017 – 2021 (first five years of the plan), 2022 – 2026 (second five years of the plan), and 2027 – 2040 (remaining years of the plan). The following roadway projects are programmed within the project vicinity in the next ten years:

RTP Regional Road Improvements (2017-2021)

- ▶ Lemmon Drive (Sky Vista Parkway to Military Road) – Widen from four lanes to six lanes

RTP Regional Road Improvements (2022-2026)

- ▶ Moya Boulevard (Red Rock Road to Echo Avenue) – Widen from two lanes to four lanes
- ▶ Military Road (Lemmon Drive to Echo Avenue) – Widen from two lanes to four lanes
- ▶ Red Rock Road (Moya Boulevard to Evans Ranch Access) – Widen from two lanes to four lanes

The Future Year study intersection lane configurations are shown on **Figure 8** and include the improvements listed above.

Traffic Volumes

Future Year (10-year horizon) intersection turning movement volumes were developed using outputs from the RTC's regional travel demand model. Base year and future year model volumes were used to develop growth rates for the study area roadways and intersections. The model shows significant growth in the Reno Stead Airport region, including the proposed project area. To avoid double counting project trips, the project land uses and trips were not removed from model outputs. Rather the model outputs and growth rates were used to develop Future Year Plus Project traffic volumes. The Future Year No Project volumes were calculated by removing the project trips from the forecasts based on the project trip generation and distribution. **Figure 9** shows the Future Year No Project traffic volumes at the study intersections, and **Figure 10** shows the Future Year Plus Project traffic volumes.

Intersection Level of Service Analysis

Future Year and Future Year Plus Project intersection level of service analysis was performed for the study intersections using Synchro 9 analysis software, with reporting based on *HCM 2010* methodology. The Stead Boulevard/Mt Babcock Street and Lear Boulevard/Military Road intersections were analyzed using SimTraffic micro-simulation software, with results also reported based on *HCM 2010* methodology. SimTraffic has the ability to more accurately analyze side-street stop controlled intersections with multi-lane approaches. A peak hour factor (PHF) of 0.92 (HCM default value) or the existing peak hour factor (whichever was higher) was used for each study intersection. The Future Year conditions peak hour intersection level of service results are presented in **Table 5** and the calculation sheets are provided in **Appendix D**, attached.

Table 5: Future Year Plus Project Intersection Level of Service

Red Rock Rd/Moya Blvd	Signal								
		10.6	B	12.4	B	11.8	B	12.8	B

Notes: 1. Delay is reported in seconds per vehicle for the overall intersection for signalized intersections, and for the worst approach/movement for side street stop controlled intersections.

Source: Headway Transportation, 2019

As shown in the table, the eastbound approach of the Stead Boulevard/Mt Babcock Street intersection is expected to operate at LOS E with and without the project under Future Year conditions; however, the delay would increase by less than 5 seconds with the project. Therefore, the project does not significantly impact the intersection and mitigation is not required. Consideration should be given to implementing a “free” eastbound to southbound right-turn at the Stead Boulevard/Mt Babcock Street intersection with future projects in the Reno Stead Airport area. That change is not justified with this project especially in consideration of the conservative estimate of truck trips.

CONCLUSIONS & RECOMMENDATIONS

The following is a list of our key findings and recommendations:

- ▶ The proposed project includes approximately 1,118,000 square feet of warehouse/industrial space located on approximately 58 acres in the southwest corner of the Reno Stead Airport property.
- ▶ The project is expected to generate approximately 1,945 Daily, 190 AM peak hour, and 212 PM peak hour trips. It was assumed that approximately 1/3 of the project trips during the peak hours would be large trucks.
- ▶ The study intersections currently operate at acceptable levels of service during the AM and PM peak hours.
- ▶ The study intersections are expected to operate at acceptable levels of service under Existing Plus Project conditions as well.
- ▶ Under Future Year No Project and Future Year Plus Project conditions, the eastbound approach at the Stead Boulevard/Mt Babcock Street intersection is expected to operate at LOS E during AM peak hour; however, the delay at the intersection is expected to increase by less than 5 seconds with the project. Therefore, the project does not significantly impact the intersection and mitigation is not required. Consideration should be given to implementing a “free” eastbound to southbound right-turn with future projects in the Reno Stead Airport area. That change is not justified with this project.
- ▶ The project proposes to construct an extension of Moya Boulevard that would serve as the primary access to the project site. As shown on the project site plan (**Figure 2**), there are six driveways on Moya Boulevard that serve the two project buildings. It is recommended that each driveway approach include one inbound lane, one outbound lane, and 75 foot left-turn pockets on Moya Boulevard into the driveways where medians are provided (see **Appendix B**).
- ▶ The Moya Boulevard extension would not align directly with the existing segment of Moya Boulevard due to right-of-way constraints. The intersection configurations shown on the exhibit in **Appendix B** are recommended to provide adequate turning radii and spacing to adjacent driveways. The alignment/connection of Moya Boulevard shall be designed and constructed with appropriate tapers and transition lengths per applicable design standards.

- ▶ The Moya Boulevard extension would cross over a minor railroad spur line that currently serves the General Motors building to the west of Moya Boulevard. The railroad crossing shall be designed and constructed in accordance with Union Pacific Railroad (UPRR) standards and permit requirements.
- ▶ The project shall pay the appropriate Regional Road Impact Fees (RRIF) based on the Regional Transportation Commission's RRIF Schedule. The estimated fees are approximately \$635,000.
- ▶ It is recommended that the RTC and City of Reno consider reclassifying Moya Boulevard to a Moderate Access Control Arterial. As the Reno Stead Airport Industrial Park develops, the additional vehicle and heavy truck traffic will justify a greater level of access control.
